EXPERIENCE

Leadership Connect, New York

Software Engineer III | March 2026 – Present

- Leading frontend architecture improvements across two codebases — driving design discussions, cross-team code reviews, and release coordination
- Rebuilding an automated signal pipeline processing thousands of weekly signals from Twitter, Facebook, news sources, and email verification services using Spring Boot, Kotlin, and Elasticsearch
- Introducing test coverage and standardized search logic to a previously untested backend system

Software Engineer II | January 2025 – March 2026

- Led frontend architecture for a 6-engineer, 6-month rebuild of a legislative bill tracking CMS — migrating from a crash-prone Vue/PHP stack to React, TanStack Query, TanStack Router, Tailwind, and Jotai
- Reduced page load times from 3+ minutes to under 2 seconds, eliminated crashes, and delivered a platform serving thousands of daily users — with no dedicated design team
- Architected state management, route caching, and navigation layers including URL param hydration, optimistic updates, and dynamic route synchronization
- Implemented code splitting, API response caching, list virtualization, and lazy loading for high-volume legislative datasets

FullStack Developer | February 2022 – January 2025

- Designed and built the company's first landing dashboard — a personalized, permission-based task system that reduced time-to-completion for daily workflows by 40%
- Built a reusable change-detection and validation framework using Jotai and Zod, replacing rigid single-use components across the application
- Modernized async data pipelines with listener middleware and bulk submission workflows, reducing processing time by 60%
- Automated CI/CD data ingestion from Twitter, Facebook, and other sources — replacing a fully manual verification workflow and saving approximately 2 hours of daily manual work per user across hundreds of users

PROJECTS

Urbanstems Clone: Full-Stack E-commerce App [urbanstems-sim.up.railway.app]

- Building a full-stack e-commerce platform with Next.js and Django using AI-assisted development — implementing server-driven filtering and image preloading optimization to eliminate visual flicker on listing pages
- Built Sproutly, an AI-assisted Python web scraper that handles bot detection, popups, and dynamic content extraction — seeded the product catalog with 1,000+ products

EDUCATION

Fullstack Academy, New York: Computer Software Engineering | Aug. 2021 – Dec. 2021

SKILLS

Languages: JavaScript, TypeScript, Python, Kotlin, HTML5, CSS3

Frontend: React, Next.js, Vue, React Native, TanStack Query, TanStack Router, Jotai, Redux, Zod, Tailwind, Styled-Components

Backend & Infrastructure: Node.js, Express, Spring Boot, Django, PostgreSQL, Elasticsearch, Firebase, AWS, Docker, Jenkins

Tools: Git, Bitbucket, Vite, Webpack, Jira, Confluence, Figma, Jest, Vitest, Playwright, React Testing Library

AI Tools: Claude, ChatGPT, GitHub Copilot, Cursor, JetBrains AI
