EXPERIENCE

Leadership Connect, New York

Software Engineer III | March 2026 – Present

- Spearheaded a proposal process to rebuild a data ingestion pipeline that powers most client-facing data — running user shadowing sessions with internal data curation teams (5 sessions, 3 teams) to surface pain points needing attention
- Leading frontend architecture improvements across two codebases — driving design discussions, cross-team code reviews, and release coordination
- Surfacing compliance violations and previously hidden gaps across new and existing records by refactoring data ingestion architecture to validate against dynamically configured taxonomy rules, using Spring Boot, Kotlin, and Elasticsearch

Software Engineer II | January 2025 – March 2026

- Led frontend architecture for a 6-engineer, 6-month rebuild of a legislative bill tracking CMS with no dedicated design team — migrating from a crash-prone Vue/PHP stack to React, TanStack Query, TanStack Router, Tailwind, and Jotai
- Reduced page load times from 3+ minutes to under 2 seconds by implementing code splitting, API response caching, list virtualization, and lazy loading for high-volume legislative datasets
- Architected state management, route caching, and navigation layers including URL param hydration, optimistic updates, and dynamic route synchronization

FullStack Developer | February 2022 – January 2025

- Designed and built the company's first landing dashboard — a personalized, permission-based task system that reduced time-to-completion for daily workflows by 40%
- Built a reusable change-detection and validation framework using Jotai and Zod, replacing rigid single-use components across the application
- Modernized data systems with listener middleware and bulk submission workflows, reducing processing time by 60%
- Automated data ingestion pipelines from Twitter, Facebook, and other sources — replacing a fully manual verification workflow and saving approximately 2 hours of daily manual work per user across hundreds of users

PROJECTS

Urbanstems: Full-Stack E-commerce App [urbanstems.francescoseddo.me]

- Built a full-stack e-commerce clone modeled on Urbanstems with Stripe checkout, order confirmation emails, and faceted URL-driven filtering (React, TypeScript, TanStack, Jotai, Tailwind + Django REST, Postgres, Redis, Docker)
- Architected a shared state pattern that composes local storage, global client state, and server data into personalized views
- Built address autocomplete with localized results, using IP geolocation for regional defaults behind a server-side Google Places proxy with Redis caching and per-IP throttling
- Built a Python scraper that handles bot detection, dynamic content, and popup interception to seed 1,000 products

EDUCATION

Fullstack Academy, New York: Computer Software Engineering | Aug. 2021 – Dec. 2021

SKILLS

Languages: JavaScript, TypeScript, Python, Kotlin, HTML5, CSS3

Frontend: React, Next.js, Vue, React Native, TanStack (Query, Router, Virtual), Jotai, Redux, Zod, Tailwind, Styled-Components

Backend & Infrastructure: Node.js, Express, Spring Boot, Django, PostgreSQL, Stripe, Redis, Elasticsearch, Firebase, AWS, Docker

Tools: Git, Bitbucket, Vite, Webpack, Jira, Confluence, Figma, Jest, Vitest, Playwright, React Testing Library

AI Tools: Claude, ChatGPT, GitHub Copilot, Cursor, JetBrains AI
